Real-Time CSPM
See, prioritize, and remediate your most critical multi-cloud risks

Managing cloud security risk continues to be a growing challenge for security and risk professionals. A never-ending list of security alerts with little to no context across disjointed tools and multi-cloud workloads makes it nearly impossible to keep up. With the growing sophistication of cloud native attacks, agentless snapshots from traditional CSPM (Cloud Security Posture Management) tools fail to provide the real-time visibility required to truly understand your cloud security risk posture.

Aqua Real-Time CSPM provides a complete view of your real-time cloud security risk, surfacing the most critical issues so you can focus on fixing what matters most. Real-Time CSPM accurately identifies cloud risks and pinpoints threats that evade agentless detection. It delivers rich, context-based insights and actionable remediation recommendations for faster, more effective cloud risk management.

Key Benefits

- Gain a complete view of your cloud security risk
- Access real-time, contextual insights
- Efficiently prioritize the most significant security issues
- Leverage actionable, expert guidance for faster remediation
- Connect issues found in the cloud back to development
- Catch threats that evade agentless detection
- Significantly reduce snapshot scanning costs

1

Accurately identify cloud security risk

Access a complete and prioritized view of your cloud security risk in real-time across your cloud workloads and infrastructure for a complete risk-posture assessment.

Gain visibility into real-time risks
Get an accurate view of risk with agentless and in-workload scanning for the ultimate visibility

Catch threats that others miss
Pinpoint memory-based attacks, fileless malware, and unknown exploit attempts like zero-days

Quickly assess risk posture
Scan workloads with agentless workload scanning to quickly assess your basic risk posture

Discover all cloud resources
Quickly connect your cloud accounts and discover all your cloud resources running in AWS, Azure, and Google Cloud

Create a unified view
Easily see, search, and drill down into specific cloud resources or risks with the unified cloud inventory

Efficiently prioritize risk and reduce alert noise

Get comprehensive, real-time context and a prioritized list of risk-based insights, correlated across hundreds of checks, to identify top issues in your environment.

Determine your real risk exposure
Understand your complete risk exposure to complex vulnerabilities and threats with contextualized risk scoring

Unify risk for a complete view
Match correlated findings across multi-cloud environments for higher-fidelity risk detection

Prioritize top risks and reduce noise
Focus on identifying the top issues with smarter insights correlated across hundreds of checks, instead of chasing false positives

De-duplicate findings to significantly reduce volumes
Determine root cause faster and eliminate noise by aggregating duplicates across findings

Rapidly remediate the most significant issues

Concentrate on fixing high-priority issues to significantly improve cloud security risk posture. Quickly connect cloud security issues to their respective code repositories, empowering developers to take ownership of security.

Remediate the most critical issues
Focus limited resources to efficiently remediate issues and make a meaningful impact on risk reduction, without sifting through noisy alerts or tickets

Manage, investigate, and respond faster
Get detailed context, understand issues, and remediate with built-in expert guidance

Ensure smarter risk management
Connect issues found in the cloud to their respective code repositories, identifying risk ownership to ensure priority issues are resolved

Conquer cloud security

Achieve a single source of cloud security truth and don't settle for less than real-time cloud security.

Rapidly prove compliance
Map your security posture to any of 30+ industry regulations and guidelines and confidently prove regulatory compliance to your management and auditors

Choose the best security approach
Deploy the best protection method per workload to balance cost and risk visibility

Move toward active protection and shift-left security
Extend risk management capabilities from dev to cloud and back with behavioral detection techniques to stop attacks in progress

Connect code to acloud with Aqua's cloud native security platform

Unify cloud native protection across the entire application life cycle, with one single source of security truth from a tightly integrated CNAPP (cloud native protection platform).
